

ADVANCED WATER STRESS INDEX (WSI)

Stephan Pfister

**ETH Zurich, Institute for Environmental Engineering,
Ecological Systems Design Group**

Supported by:

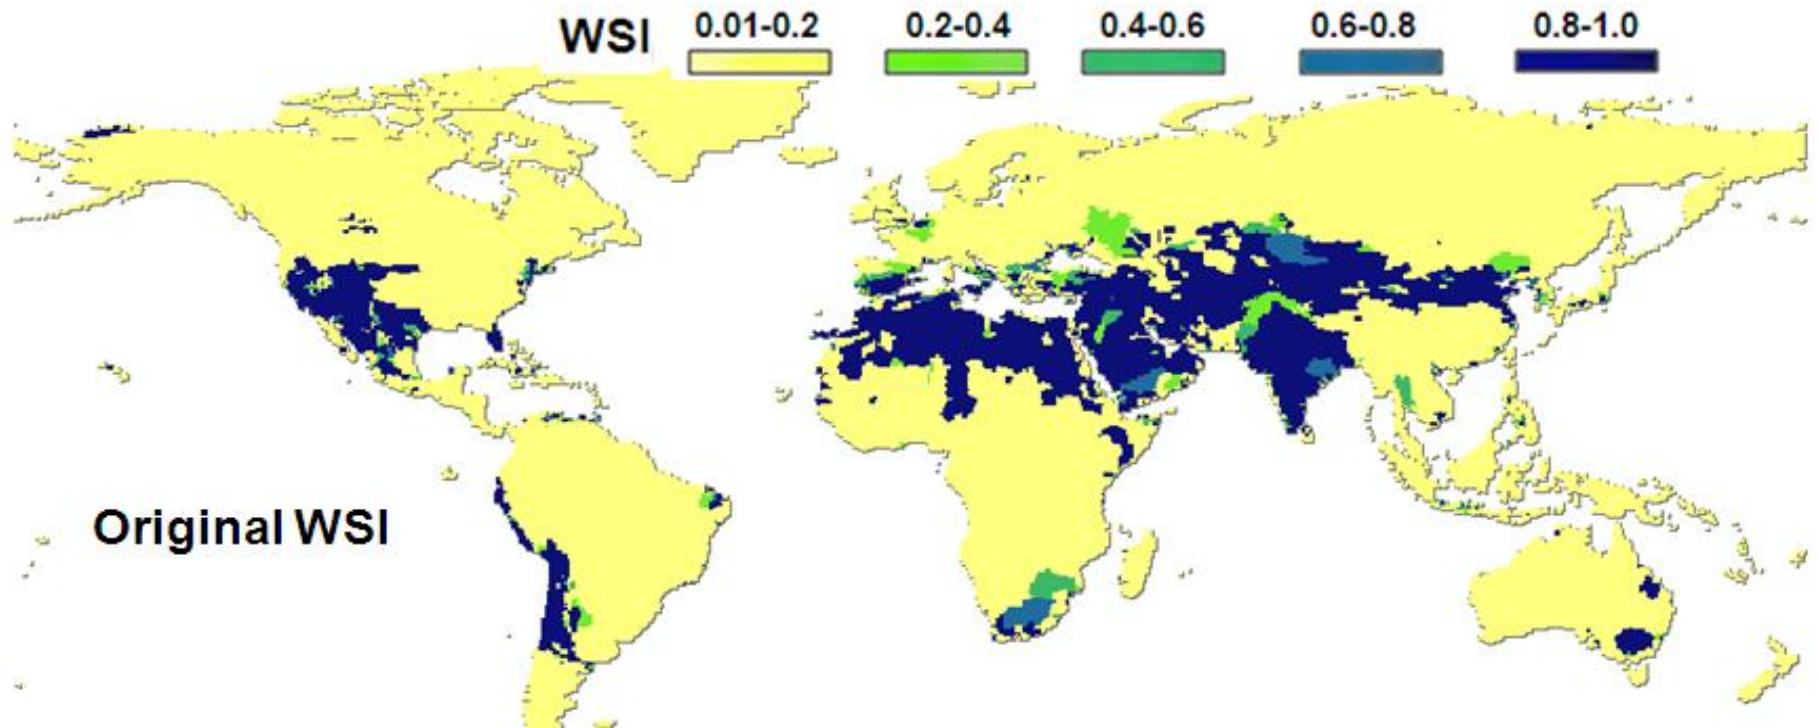

WSI - what for?

- Water footprint
- Water midpoint assessment in LCA
- Water scarcity/risk mapping tools:
 - <http://growingblue.com/the-growing-blue-tool/>
 - <http://waterriskfilter.panda.org/Maps.aspx>

WSI (Pfister et al. 2009)

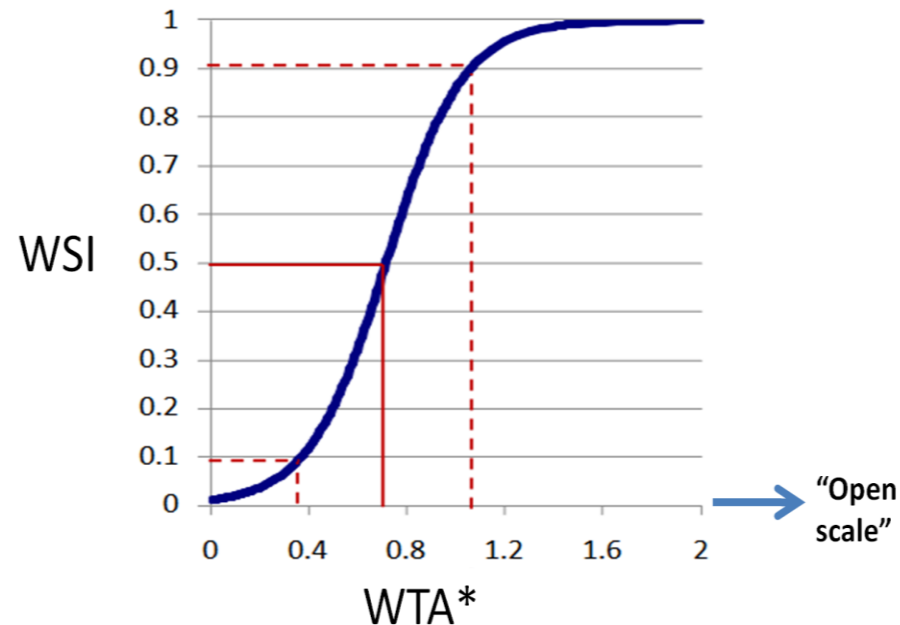

What's behind: Water Stress Index (WSI)

- **Includes:**
 - Withdrawal to availability (WTA)
 - Variability in precipitation (VF)
 - Flow regulation (highly regulated = SRF)

$$WTA^* = \begin{cases} \sqrt{VF} \times WTA & \text{for SRF} \\ VF \times WTA & \text{for non-SRF} \end{cases}$$

- **Index** following logistic function:

$$WSI = \frac{1}{1 + e^{-6.4 \cdot WTA^*} \left(\frac{1}{0.01} - 1 \right)}$$

Issues

- Hydrological background data and models
 - Old data: ref. year 1995
 - Old model: 2003
- Annual resolution
- No distinction of ground and surface water
- Overall uncertainties

Related uncertainties

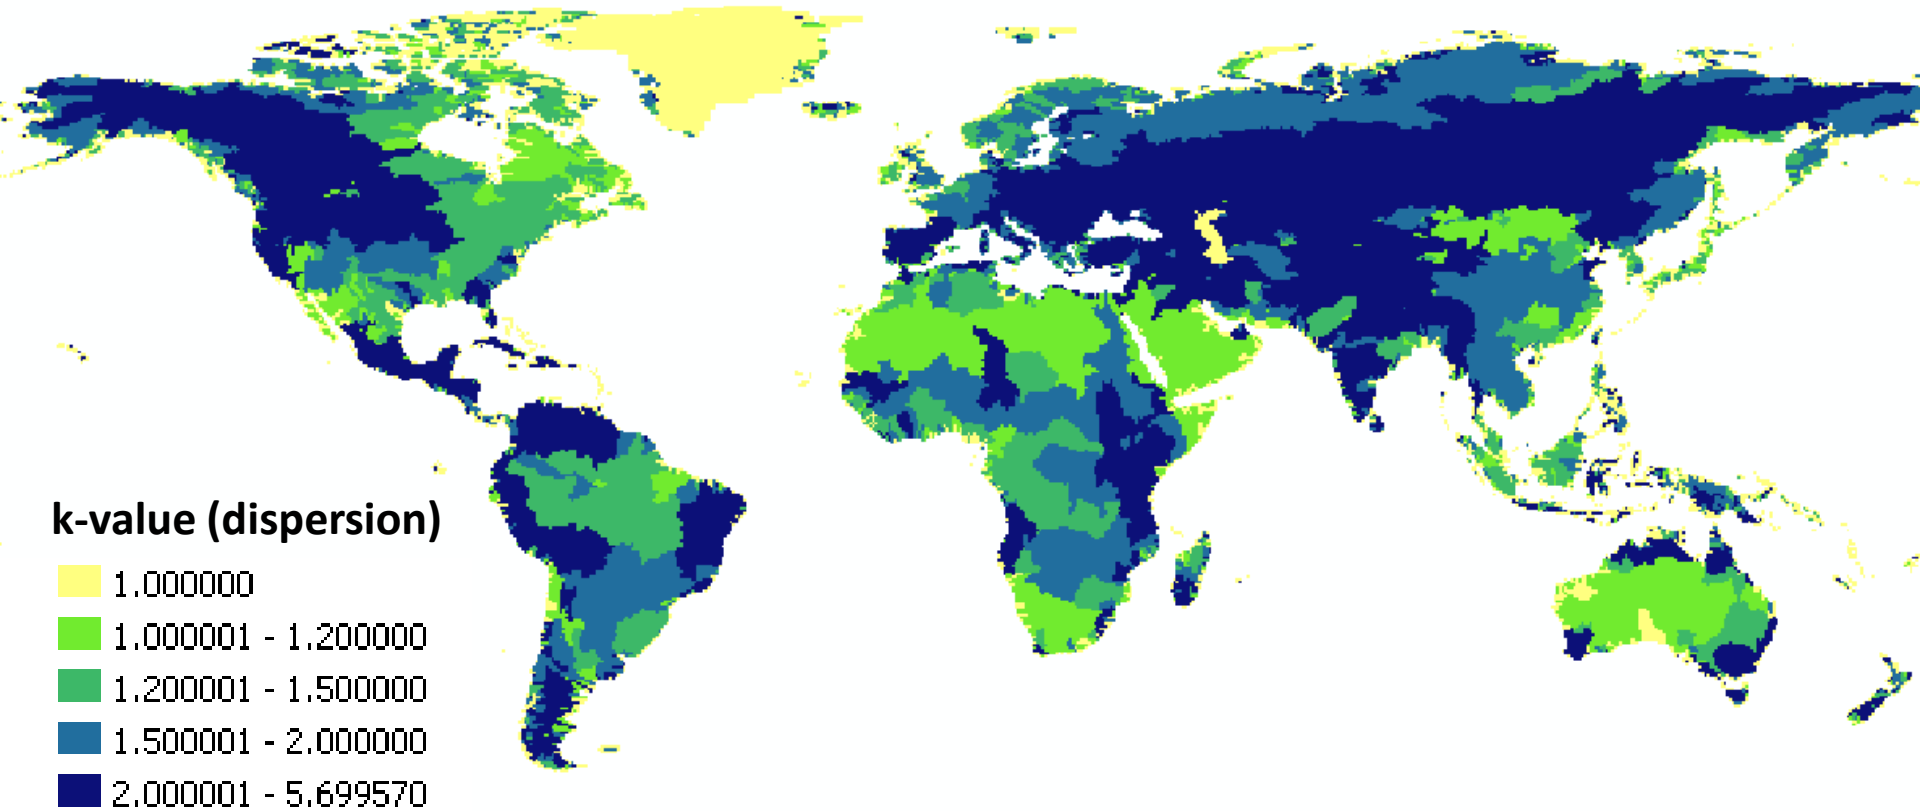

Impact assessment model step	Function	Parameters	k-value / Uncertainty function	Main source for uncertainty
Withdrawal to availability ratio (WTA)		Availability	GIS model	Based on Fekete et al. (2004)
		Withdrawals	HDI function	Based on Alcamo et al. (2003)
Water Stress Index (WSI)		VF-exponent	Binominal distribution (80/20%,)	Assumption of data accuracy
	WTA* function		VF	Precipitation distribution analysis
	WSI function		1.7	Assumption considering the logistic function

Details: http://www.ifu.ethz.ch/ESD/downloads/Uncertainty_water_LCIA.pdf

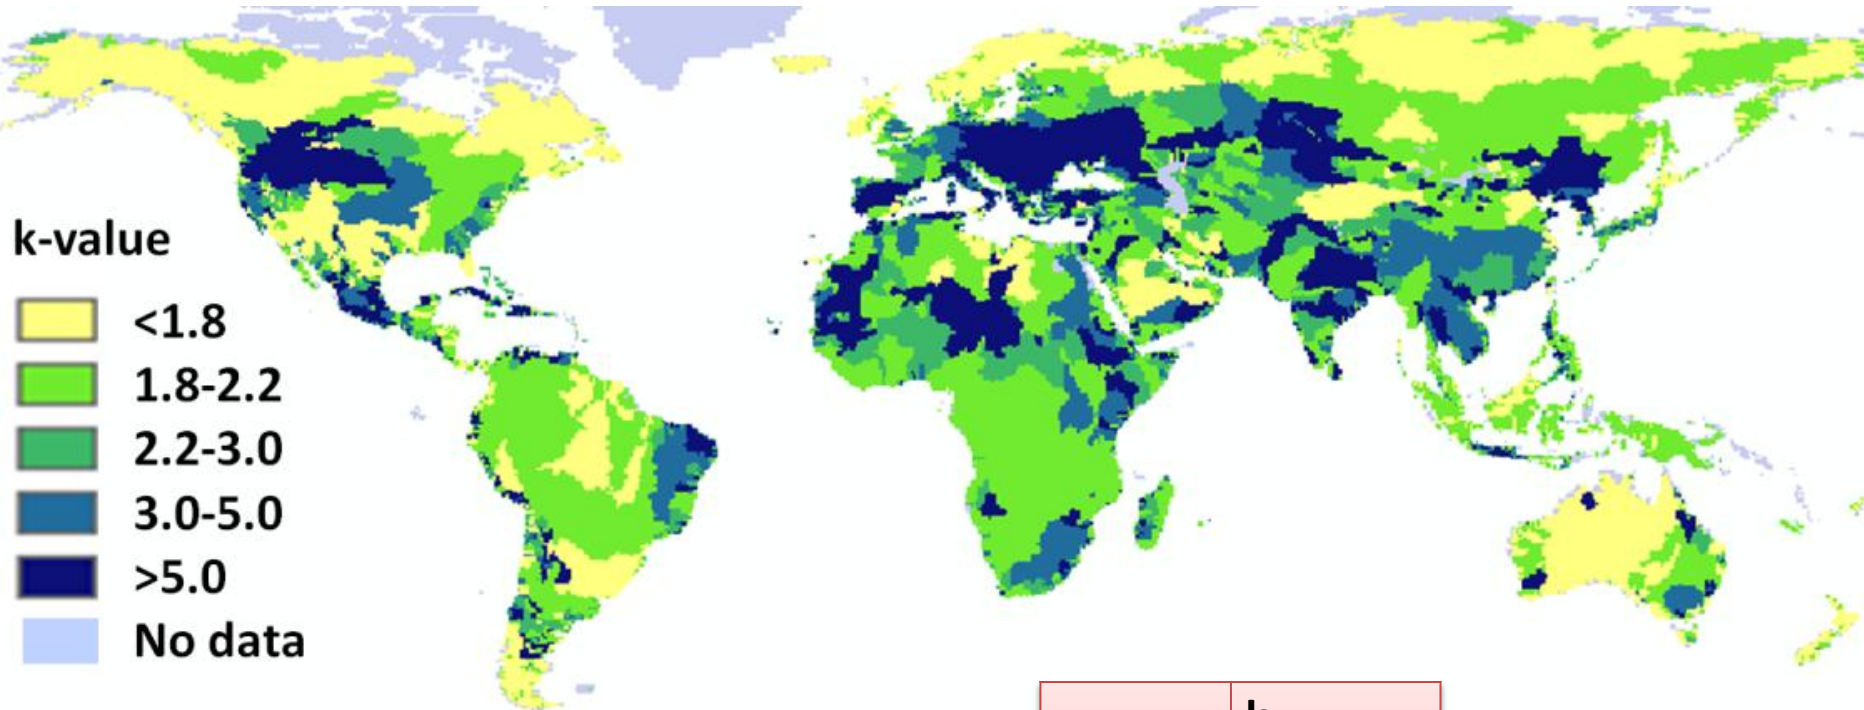

Related uncertainties: availability

Impact assessment model step	Function	Parameters	k-value / Uncertainty function	Main source for uncertainty
Withdrawal to availability ratio (WTA)		Availability	GIS model	Based on Fekete et al. (2004)

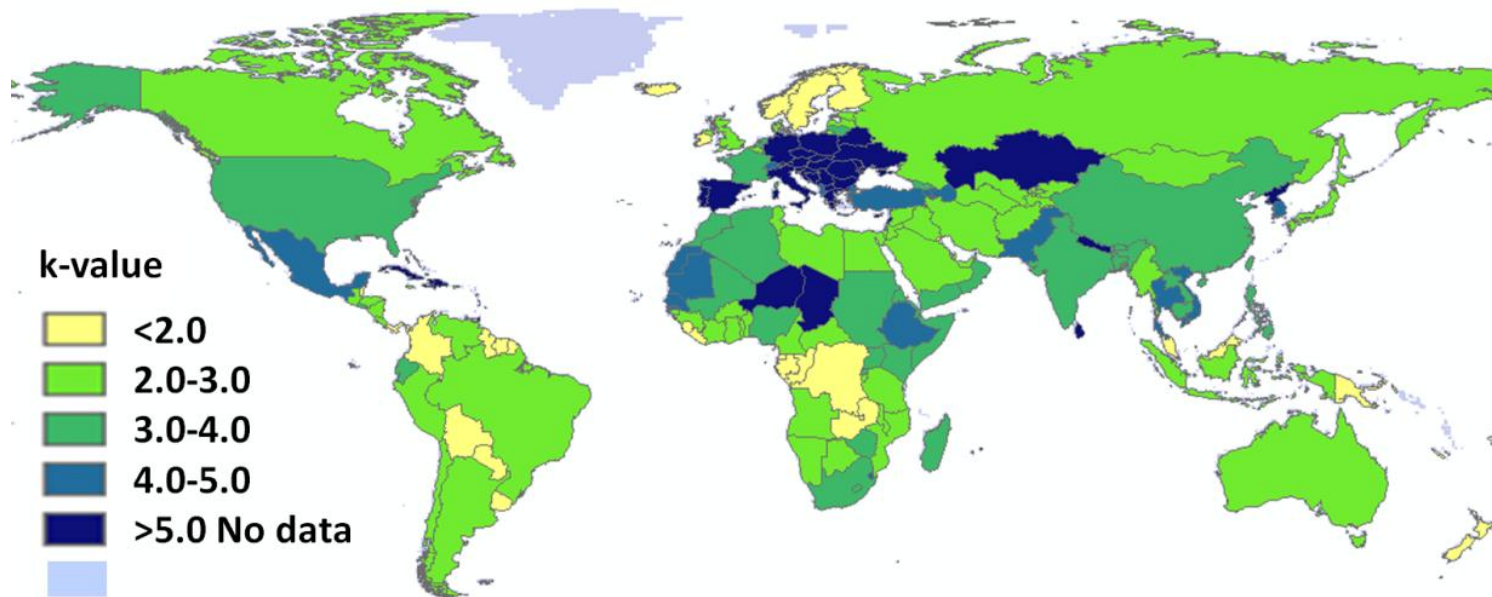

Related uncertainties: WSI

	k_{WSI}
Average	2.76
Min	1.68
Max	12.20

Uncertainty due to aggregation (Variability)

k-value caused by the **aggregation** of watershed to country resolution for **midpoint**

Report: http://www.ifu.ethz.ch/ESD/downloads/Uncertainty_water_LCIA.pdf

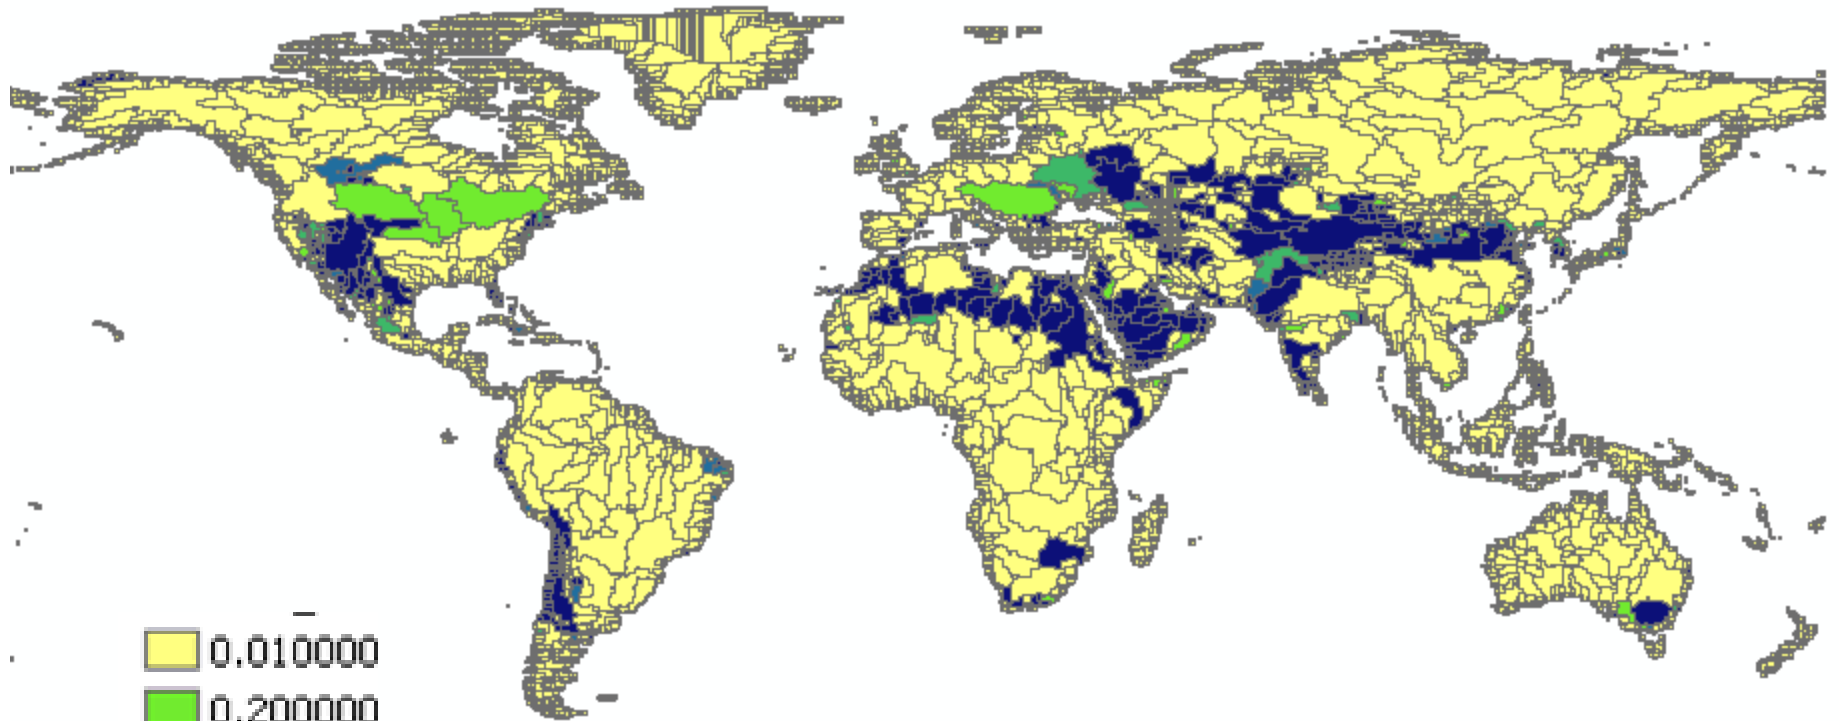

Combining monthly and annual data

- Water Gap 2 annual model (Alcamo et al. 2003)
- Monthly use-to-availability ratios
 - Vorosmarty et al. (2000) for the year 1995 on 0.5 Arc min resolution)

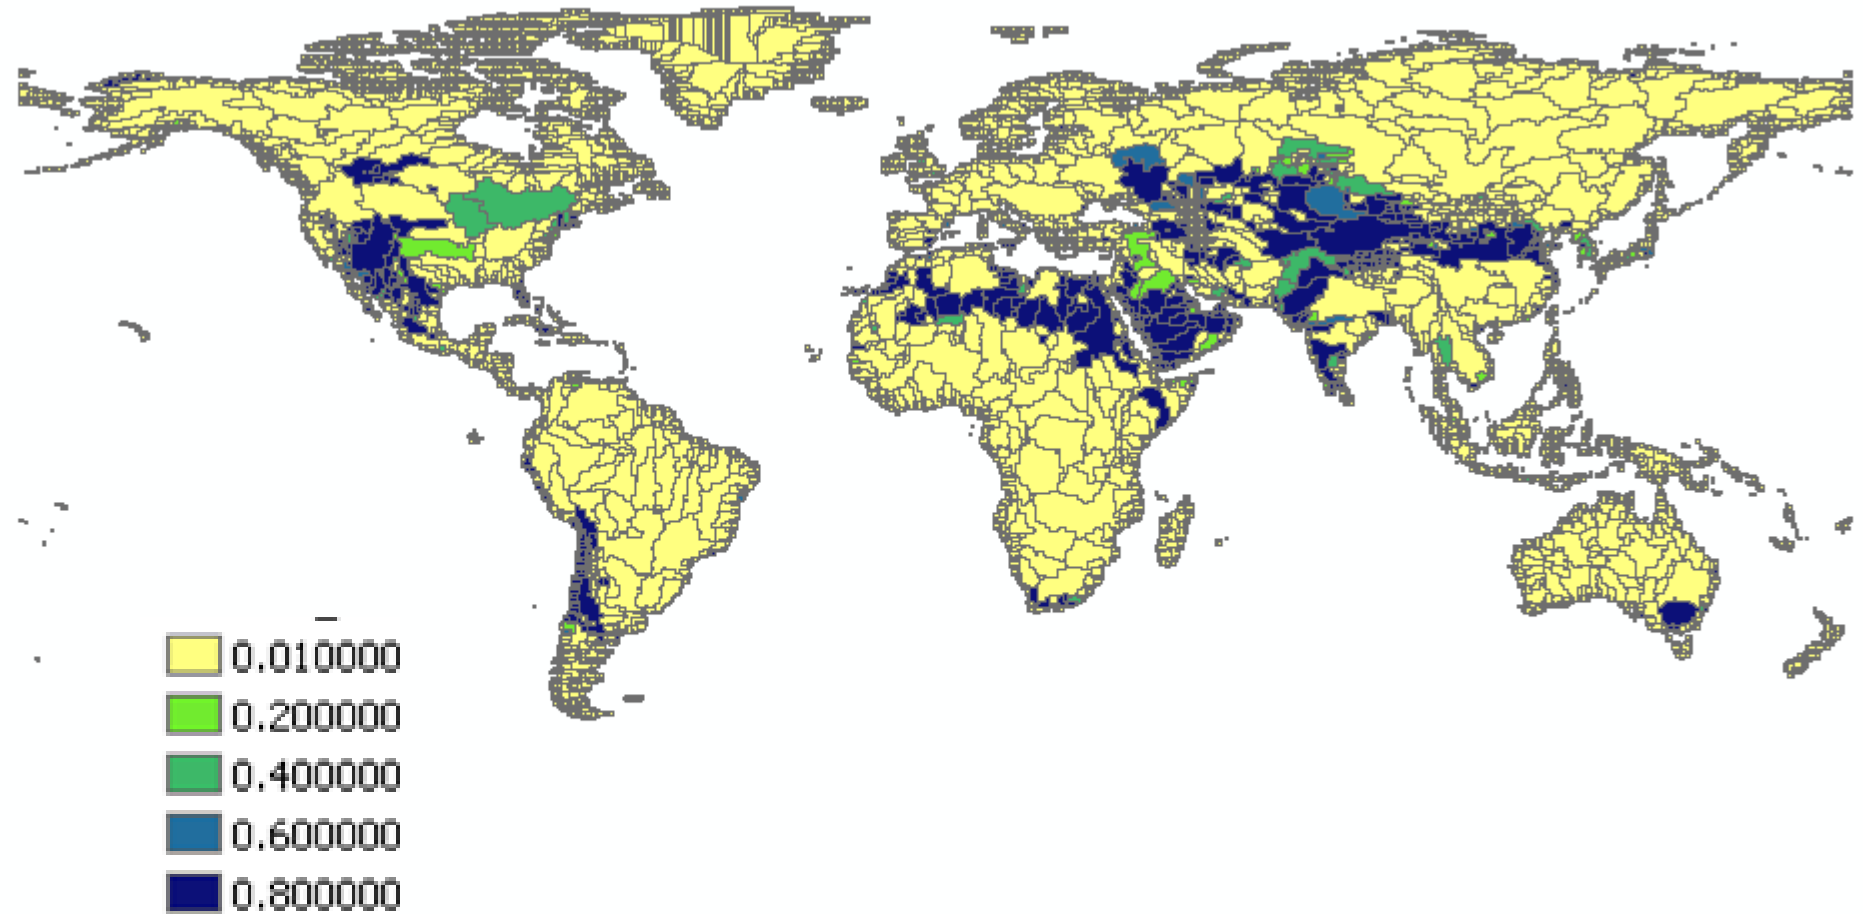

Details:

http://www.ifu.ethz.ch/ESD/downloads/Monthly_WSI/reports/Monthly_WSI_LCA_FOOD.pdf

Average monthly vs. annual WSI

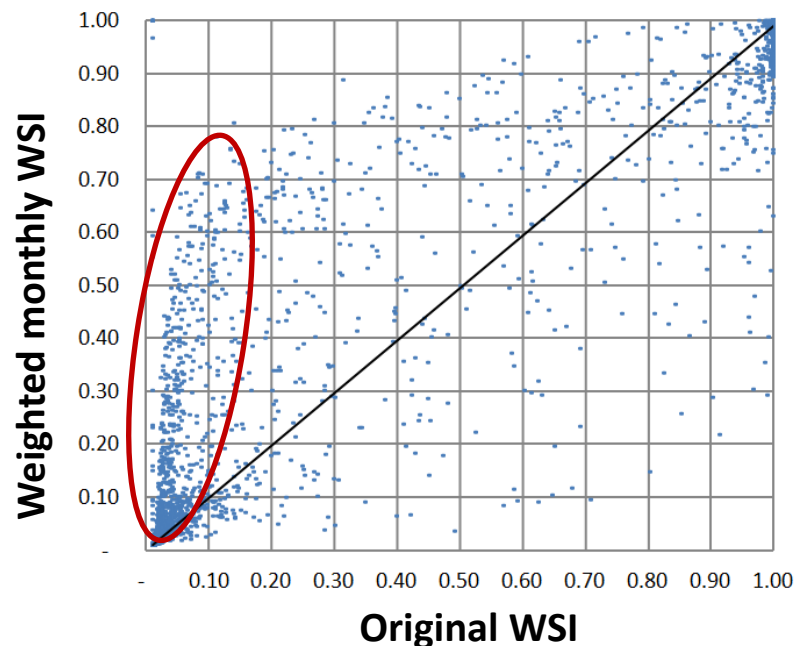

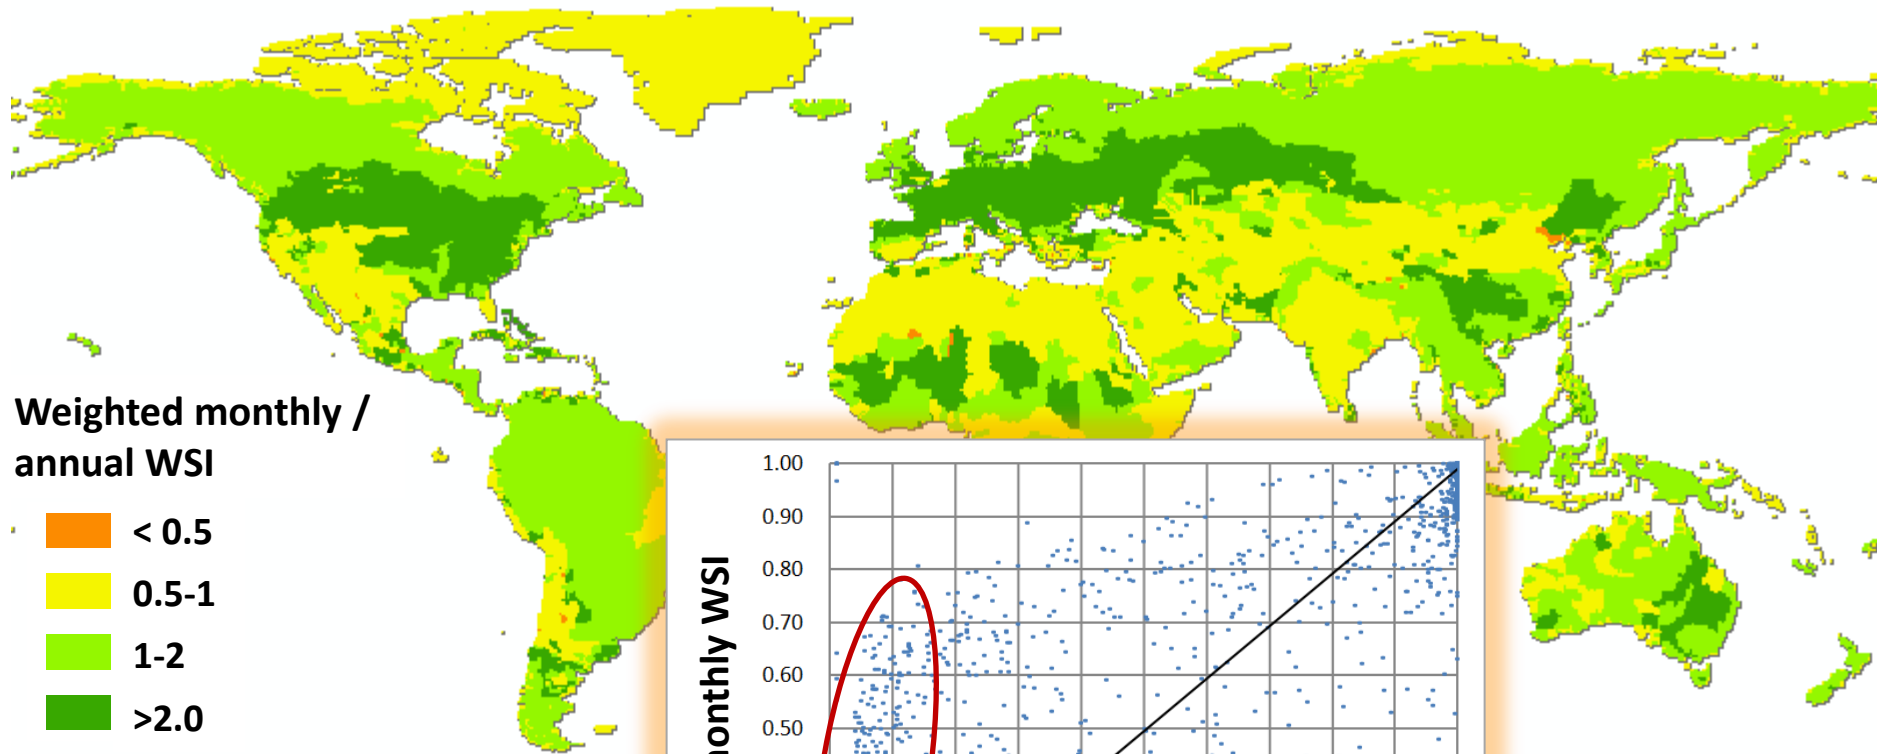

Weighted monthly vs. annual WSI

Ratio weighted monthly vs. annual WSI

- Monthly resolution reveals higher stress in many watersheds

Moving average (August example)

Normal

$$(i-1) + (3 * i) + (i+1)$$

Ratio moving / normal (august)

To be included for monthly WSI

- Storage effects
 - Dams
 - Groundwater
- Withdrawal vs. consumption based WSI
 - Use adds to pressure
- Water source (ground surface water)
 - Different characteristics
- Spatial & temporal resolution induced uncertainty
 - Aggregated datasets

Comparison WATCH results

- Hydrological data update
 - Ref year 2010
 - Comparison of different models
- Consumption to availability (CTA)
- Groundwater / surface water distinction

Comparison WTA/CTA

- WSI_WTA

unspecific

Endpoint based WSI

Ecosystem
Quality

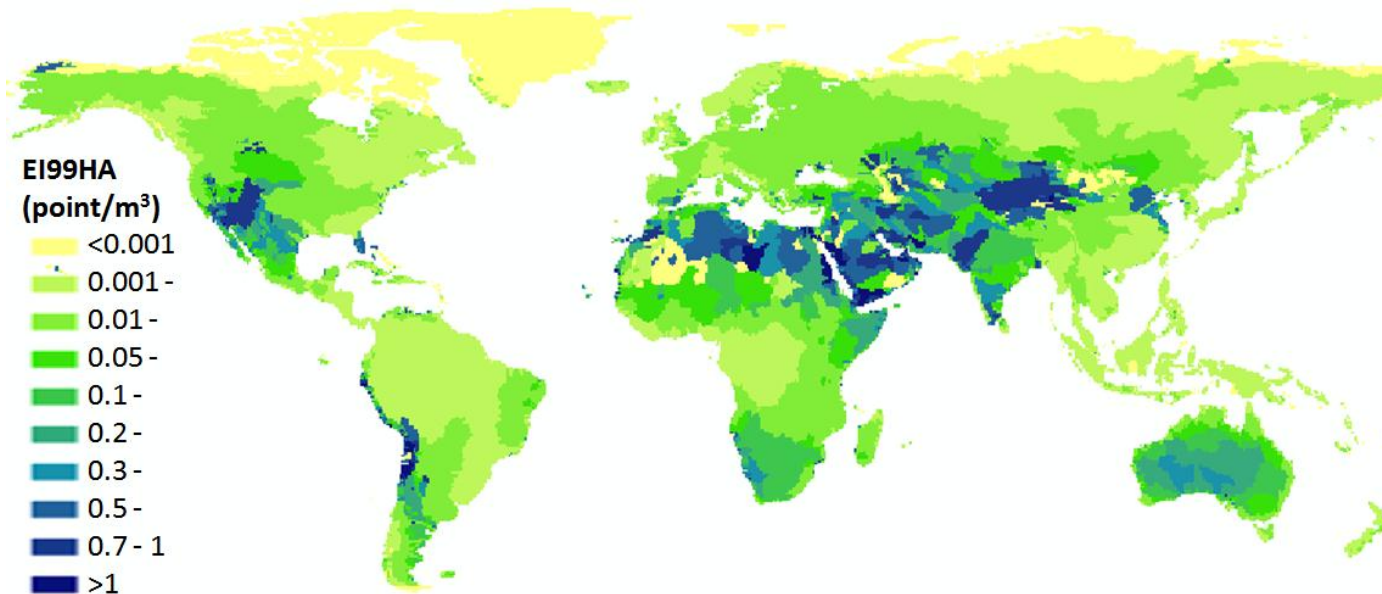

Human health

Endpoint based WSI

EI99 single score

Different indicator scale differently!

Conclusions

- **Hydrological models** need to be improved and better integrated
- **Monthly** resolution is relevant for **agriculture**
- **Consumption** based WSI adds information
- **Surface / groundwater** use needs to be better distinguished
- **Quality aspects** can improve indicator (data limitation)
