Integrating ecoinvent into an energy systems model

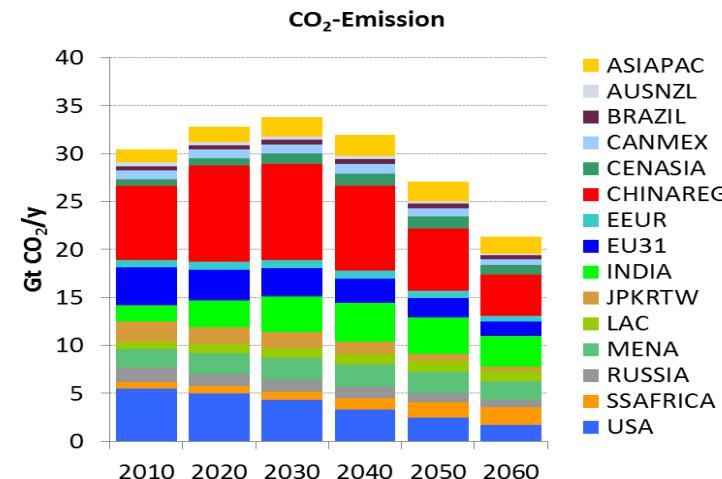

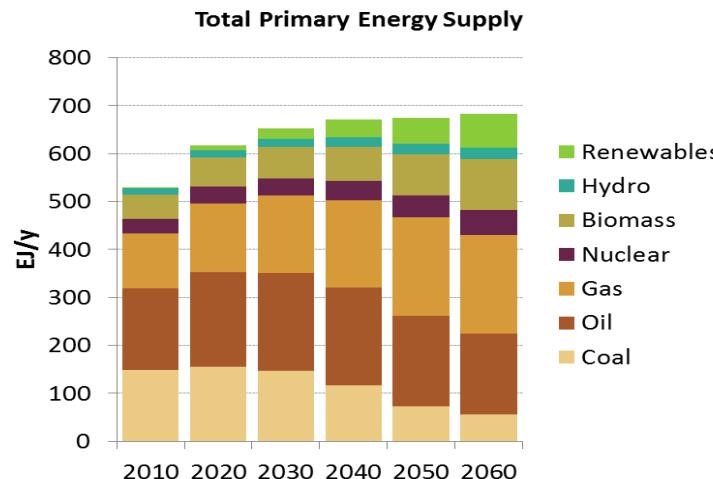

LCA DF 64, 30 March 2017, ETH Zurich, Switzerland

Outline

- Motivation
- Approach
- Uncertainties and limitations

Motivation

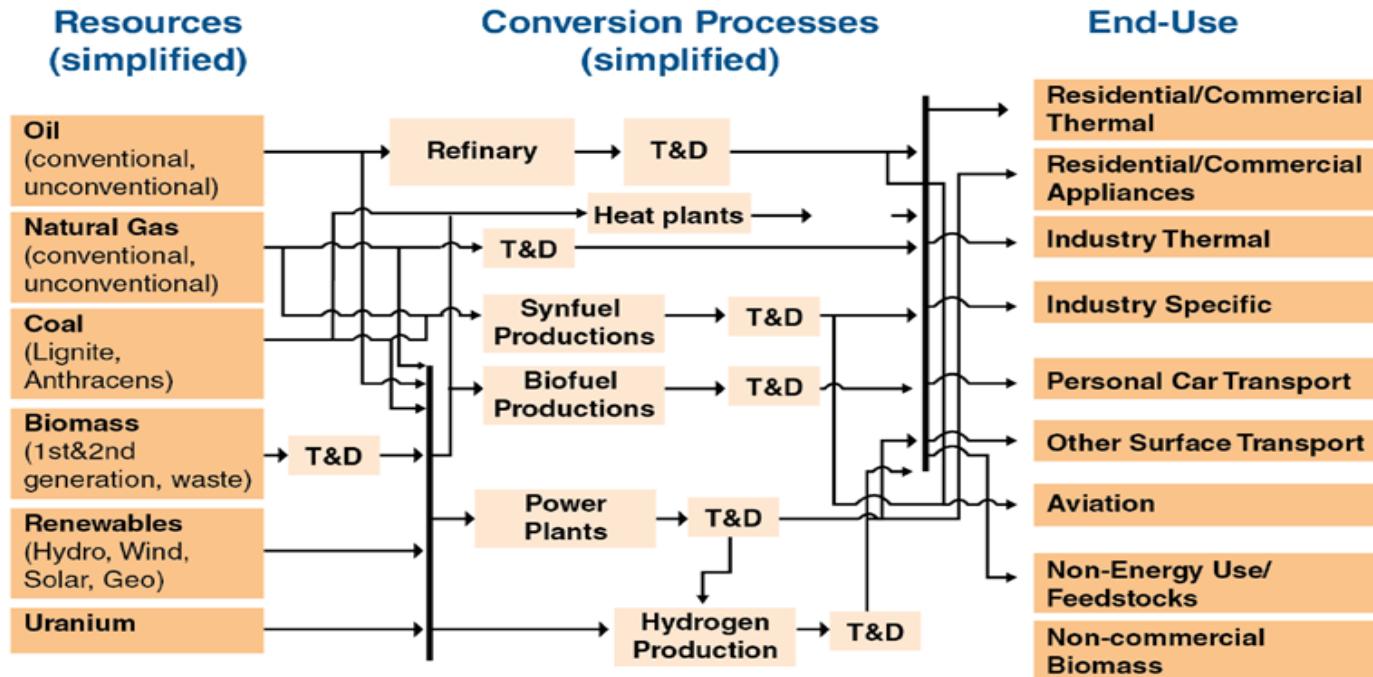

- Energy system modelling
- 3 World Energy Scenarios
- 15 world regions
- 2010-60

- Impacts on human health and ecosystems?

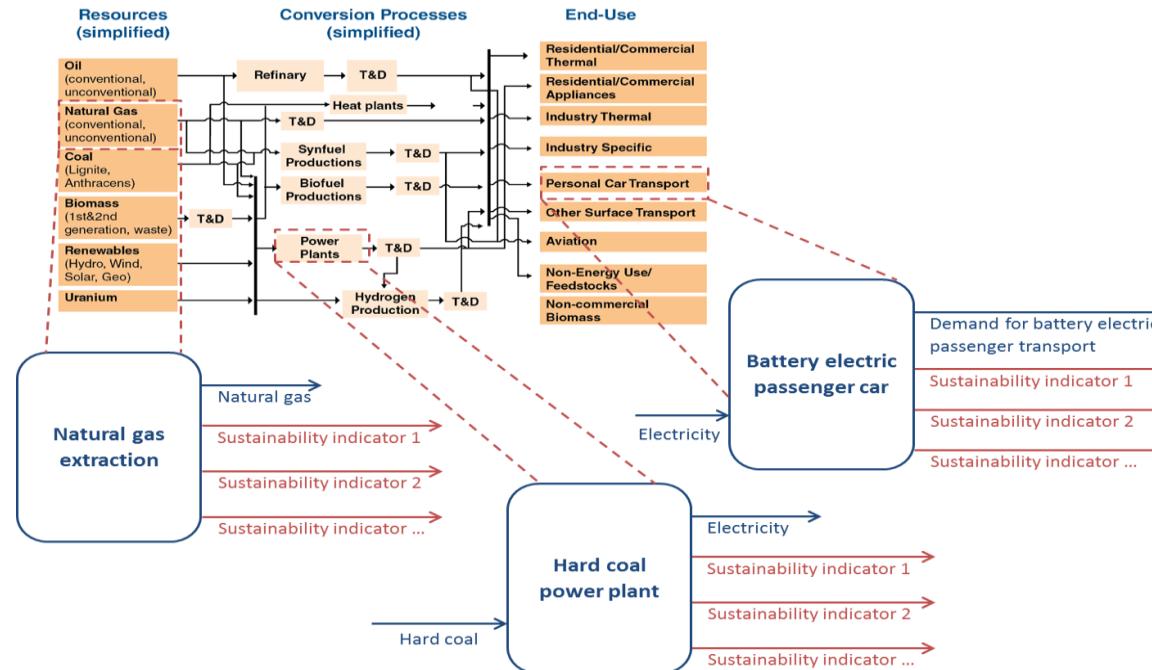

Modelling of the energy system

- Technology-based partial equilibrium energy system model
- Reference Energy System: Resources – Conversion – End-use
- Techno-economic characteristics

Approach

- 1) Matching of LCI data and energy system model processes
- 2) Subdivision of the LCI data
- 3) Preparation of the background database
- 4) Calculation of the life-cycle impacts and implementation in the energy system model

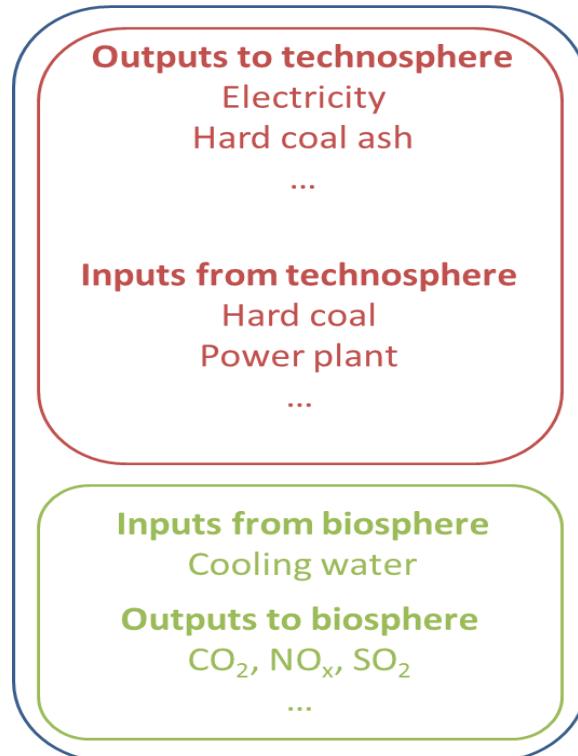

Step 1: Matching

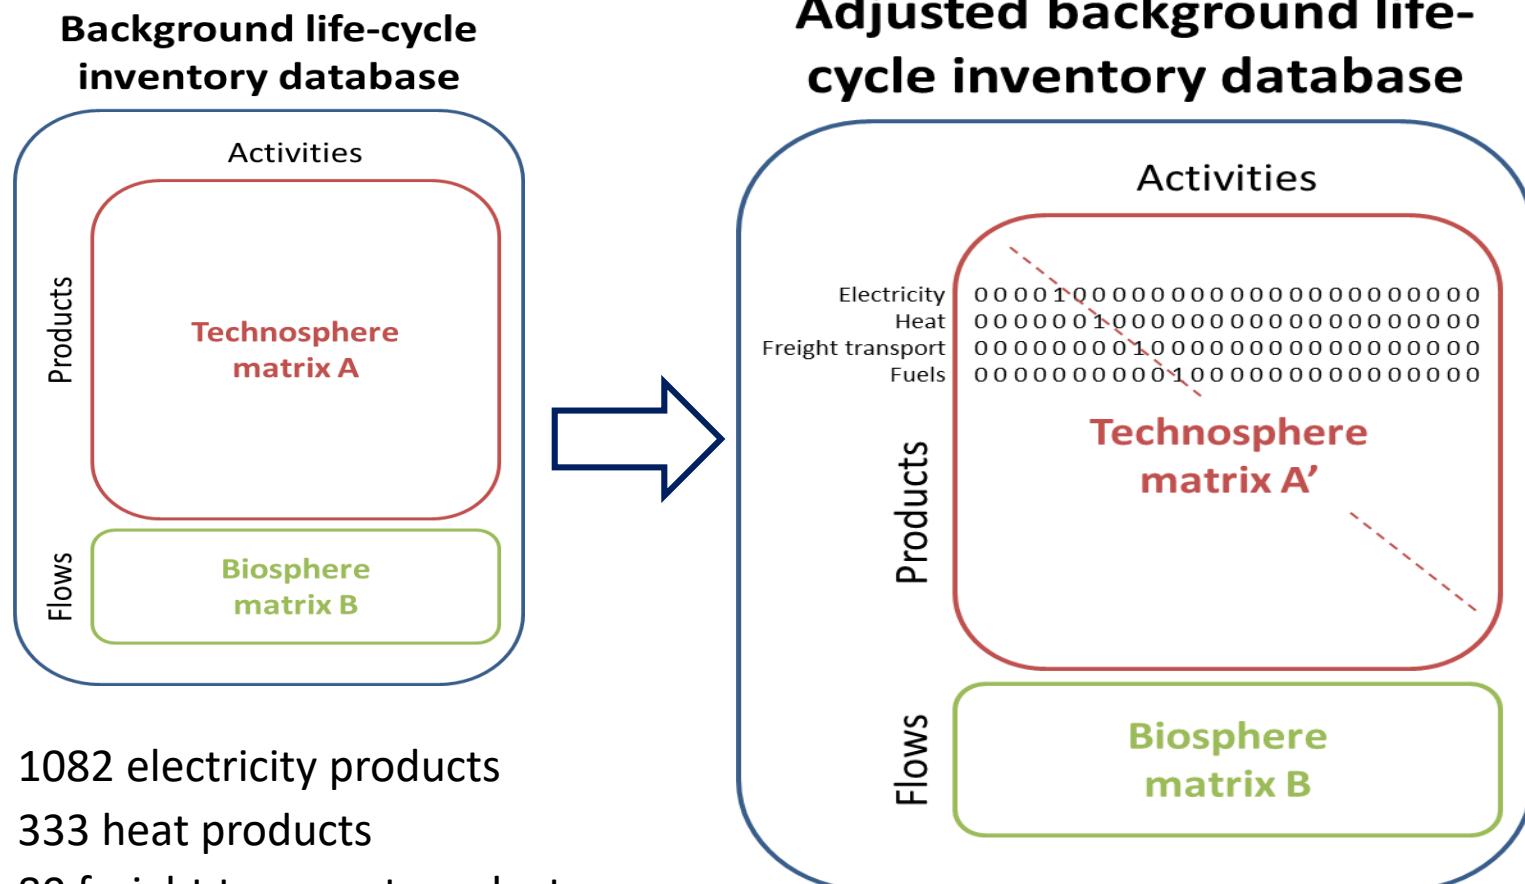

- Technological
 - CHP, energy own use, ...
 - dummies, sectors, ecoinvent version, ...
- Regional
- Temporal

E61	Onshore Wind turbine	Electricity, high voltage {xxx} electricity production, wind, >3MW turbine, onshore	[75]						
E62	Offshore Wind Park	Electricity, high voltage {xxx} electricity production, wind, 1-3MW turbine, offshore	[75]						
E6A	Cogeneration Gas Turbine	Heat, central or small-scale, natural gas {xxx} natural gas, burned in micro gas turbine, 100kWe	[75]

Step 2: Subdivision

Life-cycle inventory electricity generation from hard coal

- 1082 electricity products
 - 333 heat products
 - 80 freight transport products
 - 128 energy carriers

Step 4: Calculation & Implementation

- Calculation of the cumulative results for each process and region
 - per operation (direct)
 - per operation (indirect)
 - per infrastructure

						Heat and power co-generation unit, 6400kW thermal, components for	GLO

- Post-processing (unit, energy content, efficiency)
- Implementation in the energy system model

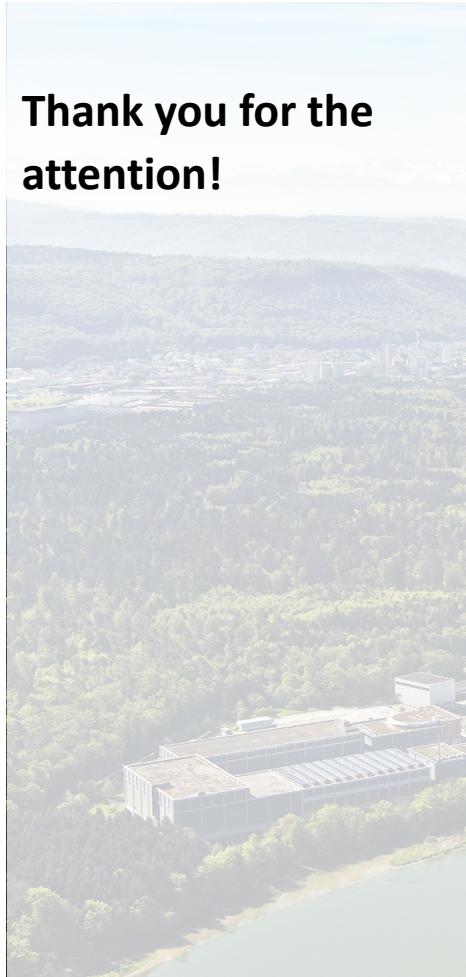

Uncertainties and Limitations

- Inconsistency in the LCI data (different data sources due to missing technologies)
- Missing regions
- Constant background
- Differentiation direct vs. indirect
